

Investment Memo: Glint

Quick descriptors

- “Hallucination Protection Layer for DeFAI”
- “Trustworthy Decentralized Financial AI” = “Human-vetted Analytics” + “AI-Powered Data Processing”

Executive Summary:

Glint provides a Hallucination Protection Layer for Decentralized Financial AI (DeFAI).

- They have human-vetted analytics with advanced AI data processing, creating a reliable and accurate blockchain analytics feed essential for AI agents.
- Glint Analysts used intuitive, low-code tools to rapidly generate actionable insights. These insights are then validated and stored in a vector database, forming the foundation of the Glint API - built specifically to serve the DeFAI economy. By addressing the critical trust gap in autonomous financial systems, this approach ensures that AI-driven decisions are grounded in verified, enriched, and contextualized blockchain data.

Technical Resources

- [Glint Analytics Documentation](#)
- [Glint App](#)

Longer form reading material

Deal Terms

- Stage: Pre-seed (first fundraise)
- Instrument: SAFE with Token Warrant (2:1)
- Raise: \$3M at \$22.5M / \$45M FDV

What they've done

Glint successfully launched an initial alpha version, rapidly attracting early testers, generating positive feedback, and becoming one of the winners of the Solana Demo Day

2025 at the Solana Economic Zone in Dubai.

Their Backers

Glint is backed by grants from notable blockchain companies including **Avalanche Foundation**, **Superteam UAE**, and **Metaplex**.

Why

Glint provides crucial functionality for enabling a reliable DeFAI ecosystem:

- **Faster Time-to-Insights:** Intuitive and low-code tooling, and advanced chart types, for rapid analytics and insight generation through beautifully designed dashboards.
- **Tokenized Rewards:** Analysts receive fair incentives (GLNT tokens) for verifying, enriching, contextualizing blockchain data - ensuring continuous, trusted, high-quality insights.
- **Trustworthy Human-Verified Insights:** Combines community-vetted intelligence with machine-readable trust indicators, preventing inaccurate or incomplete information, and enabling reliable, informed decisions in DeFAI.
- **AI-Optimized Data API:** Near real-time, standardized blockchain data with built-in visualizations - tested and optimized for seamless AI agent integration.

How

Glint's platform architecture consists of several interconnected and robustly designed components:

- **Low-Code AI Analytics Interface:** Provides an intuitive environment featuring an AI-powered dashboard creator, allowing users to effortlessly construct sophisticated visual analyses. Its natural language query capabilities make complex data queries accessible without deep technical expertise, while the visual builder facilitates interactive and visually appealing dashboard creation.
- **API Layer:** Glint offers an advanced AI-optimized data API, delivering real-time standardized blockchain data equipped with built-in visualizations. This API is specifically designed for smooth and efficient integration with AI agents, enhancing their analytical and decision-making capabilities.
- **Glint Core Platform:** The heart of Glint, this platform comprises multiple sophisticated elements including data processing pipelines, a powerful analytics engine for extracting deep insights, account programs for structured user engagement, tokenized rewards systems to incentivize quality contributions, and community features promoting user interaction and collaboration. Together, these components create a robust cross-protocol intelligence engine, fortified by a machine-readable reputation system for ensuring data reliability and accuracy.
- **Blockchain Data Layer:** The foundational layer that enables comprehensive blockchain data management through program indexing, historical analytics for trend assessment, and real-time data processing capabilities. This ensures the availability of timely, accurate, and holistic data for analysis.

Selected use cases

- Autonomous Trading Bots: AI agents leverage real-time blockchain data to identify and act on market opportunities with minimal human input.
- Risk & Anomaly Detection: Agents monitor onchain activity to detect irregular patterns, flag protocol risks, or prevent fraud in real time.
- Cross-Protocol Yield Optimization: DeFAI agents compare returns across protocols and chains to dynamically reallocate assets for better yields.
- Portfolio Intelligence & Reporting: Agents automatically produce personalized portfolio reports or risk dashboards for funds, DAOs, or individuals.
- Agent-Generated Research & Content: AI uses Glint's structured intelligence to generate articles, threads, or summaries for media, analysts, or KOLs.

Team

Glint was founded by Brendan Mannion (CEO), and Ian Harrigan (CTO). The team combines over 100 years of expertise in blockchain technology, data analytics, software engineering, and marketing.

- Brendan Mannion, CEO, experienced blockchain startup leader and senior project manager. MSc Fintech Management.
- Ian Harrigan, CTO, 20+ years in senior software engineering, creator of HaxeUI. MSc Software Engineering.
- Dhruv Chaturvedi, Marketing Lead, former head of marketing at prominent blockchain companies.

Why it Could Win

- Well-defined niche (DeFAI) with a clear value proposition— *fits our thesis*.
- Defensible moat through human-in-the-loop validation and tokenized community.
- AI-native API positioning aligns with the next wave of agent-based DeFi— this B2B TAM right.
- Credibility and early validation from the Solana ecosystem — backchannelled with Kash Dandha, John and Akshay from the foundation.

Risks

- Early-stage: unclear product-market fit outside of Solana-centric early adopters.
- Competition from incumbents adding AI features (e.g., Nansen, Dune).
- Token economics — has unclear unlocks
- No evidence yet of large-scale paying customers or network effect yet..

My Take

Glint is addressing a timely and growing pain point in DeFi — the lack of trustworthy, structured, AI-consumable blockchain data. The approach is differentiated enough to carve

out a niche in the emerging DeFAI stack. The founding team has a credible background in blockchain, software engineering, and market development, and has demonstrated early execution ability through product delivery and ecosystem recognition. While the stage remains early with key risks around scaling and adoption, I view this as a reasonable optionality bet on the DeFAI narrative, backed by a capable team.

On balance, I recommend a small but high-conviction allocation at this stage, subject to satisfactory due diligence and clarity on token economics and customer pipeline.

Decision: *IC Passed — proceed with allocation, subject to final DD and term sheet.*
